### Fabric Explored

A Technical Deep-Dive on Hyperledger Fabric

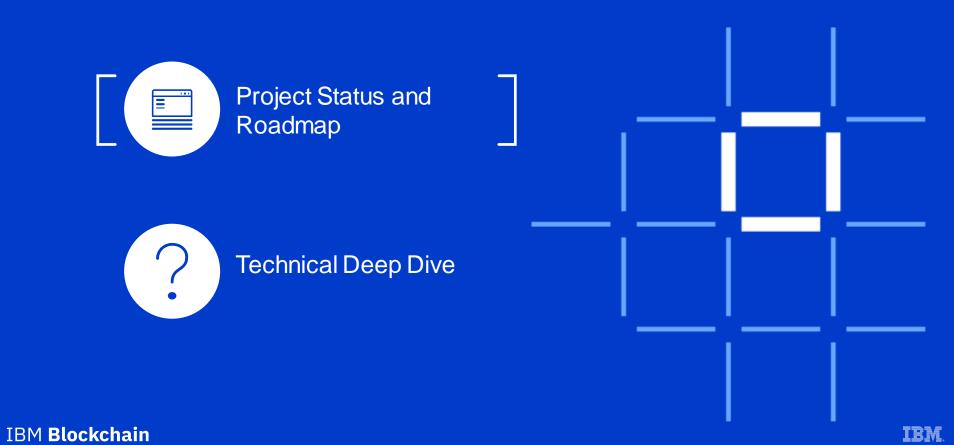

Guillaume Lasmayous – <u>guillaume.Lasmayous @fr.ibm.com</u> IT Specialist, Blockchain Center of Competency IBM Client Center Montpellier, France

Guillaume Hoareau <u>guillaume hoareau@fr.ibm.com</u> IT Architect, Security IBM Client Center Montpellier, France

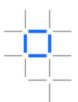

V4.6, 19 October 2018

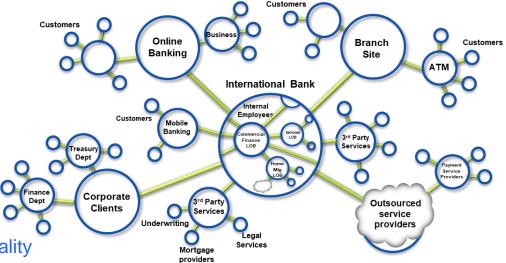

### Blockchain Recap

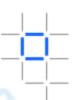

- Blockchain builds on basic business concepts
  - Business Networks connect businesses
  - Participants with Identity
  - Assets flow over business networks
  - Transactions describe asset exchange
  - Contracts underpin transactions
  - The ledger is a log of transactions
- Blockchain is a shared, replicated ledger
  - Consensus, provenance, immutability, finality

## What is Hyperledger Fabric

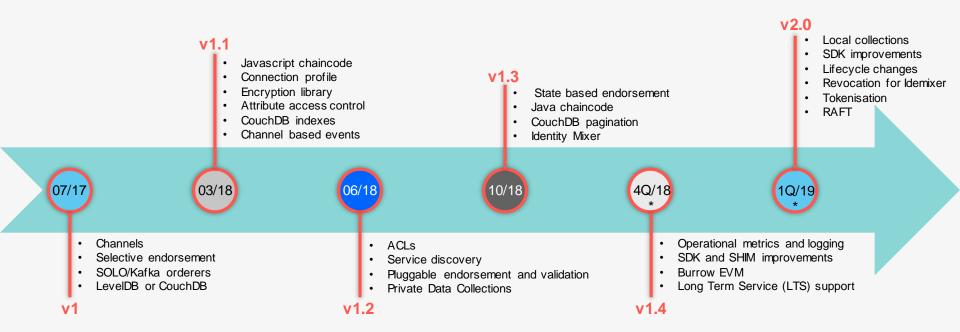

- Linux Foundation Hyperledger
  - A collaborative effort created to advance cross-industry blockchain technologies for business
- Hyperledger Fabric
  - An implementation of blockchain technology that is intended as a foundation for developing blockchain applications
  - Key technical features:
  - A shared ledger and smart contracts implemented as "chaincode"
  - Privacy and permissioning through membership services
  - Modular architecture and flexible hosting options
- V1.0 released July 2017: contributions by 159 engineers from 27 organizations
  - IBM is one of the contributors to Hyperledger Fabric

# Roadmap

# Overview of Hyperledger Fabric v1 – Design Goals

- Better reflect business processes by specifying who endorses transactions
- Support broader regulatory requirements for privacy and confidentiality
- Scale the number of participants and transaction throughput
- Eliminate non deterministic transactions
- Support rich data queries of the ledger
- Dynamically upgrade the network and chaincode
- Support for multiple credential and cryptographic services for identity
- Support for "bring your own identity"

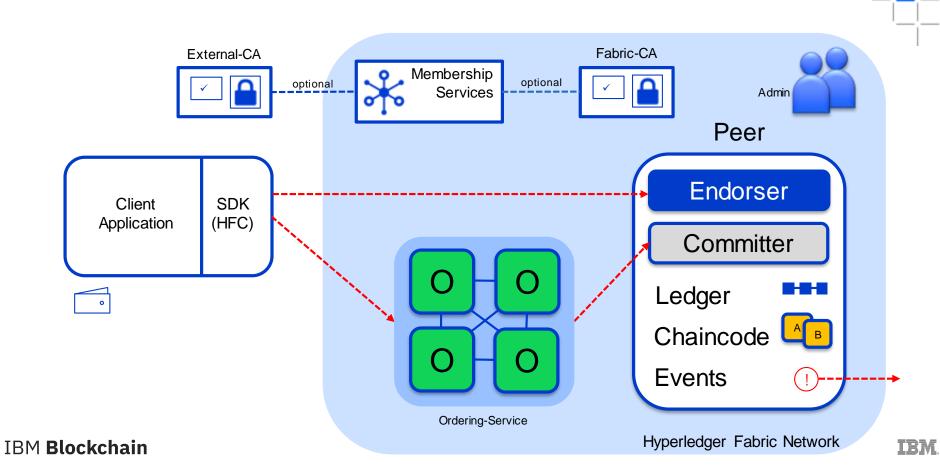

### **Technical Deep Dive**

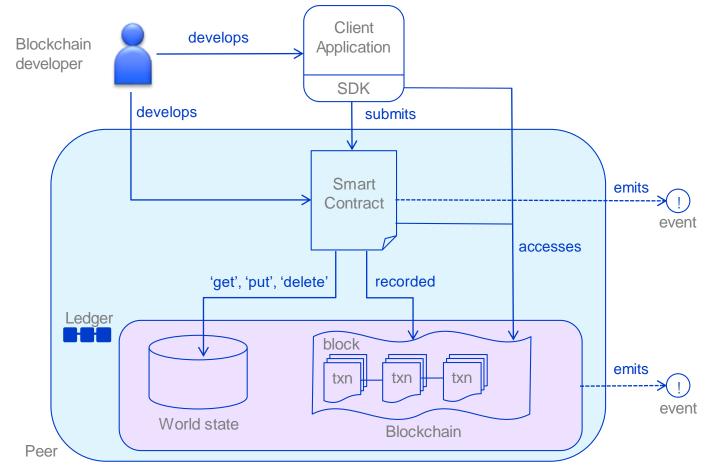

- [ Architectural Overview ]
- Network Consensus
- Channels and Ordering Service
- Components
- Network setup
- Endorsement Policies
- Membership Services

# Hyperledger Fabric V1 Architecture

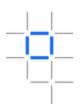

# How applications interact with the ledger

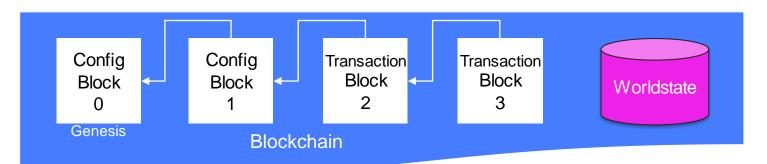

## Fabric Ledger

- The Fabric ledger is maintained by each peer and includes the blockchain and worldstate
- A separate ledger is maintained for each channel the peer joins
- Transaction read/write sets are written to the blockchain
- Channel configurations are also written to the blockchain
- The worldstate can be either LevelDB (default) or CouchDB
  - LevelDB is a simple key/value store
  - CouchDB is a document store that allows complex queries
- The smart contact Contract decides what is written to the worldstate

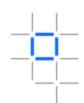

### **Technical Deep Dive**

- Endorsement Policies
- Membership Services

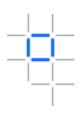

IBM

### Nodes and roles

Peer: Maintains ledger and state. Commits transactions. May hold smart contract (chaincode).
Endorsing Peer: Specialized peer also endorses transactions by receiving a transaction proposal and responds by granting or denying endorsement. Must hold smart contract.
Ordering Node: Approves the inclusion of transaction blocks into the ledger and communicates with committing and endorsing peer nodes. Does not hold smart contract. Does not hold ledger.

# Hyperledger Fabric Consensus

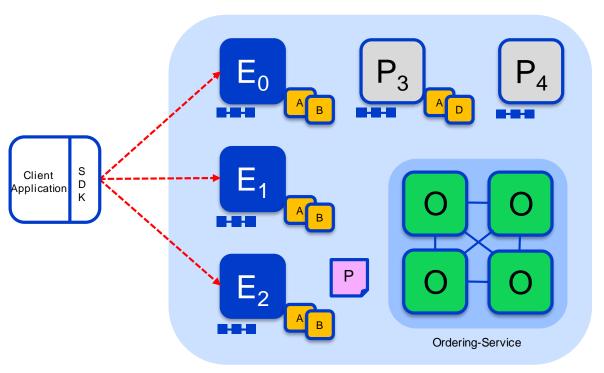

Consensus is achieved using the following transaction flow:

Endorse Order Validate

### Sample transaction: Step 1/7 – Propose transaction

Hyperledger Fabric Network

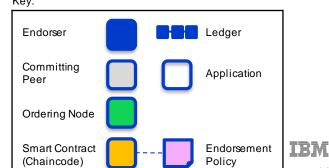

Application proposes transaction

### Endorsement policy:

- "E<sub>0</sub>, E<sub>1</sub> and E<sub>2</sub> must sign"
- (P<sub>3</sub>, P<sub>4</sub> are not part of the policy)

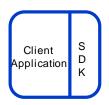

Client application submits a transaction proposal for Smart Contract A. It must target the required peers  $\{E_0, E_1, E_2\}$ 

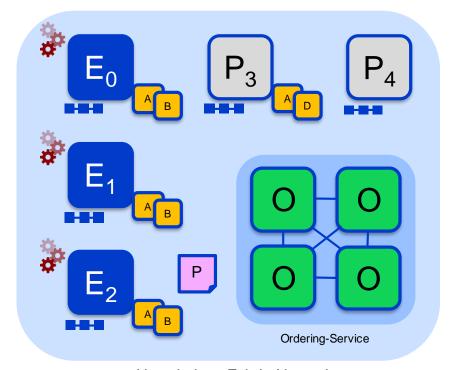

Key:

### Sample transaction: Step 2/7 – Execute proposal

Hyperledger Fabric Network

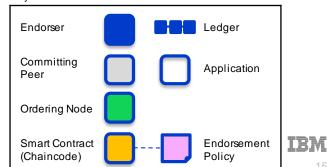

### **Endorsers Execute Proposals**

 $E_0$ ,  $E_1$  &  $E_2$  will each execute the proposed transaction. None of these executions will update the ledger

Each execution will capture the set of Read and Written data, called RW sets, which will now flow in the fabric.

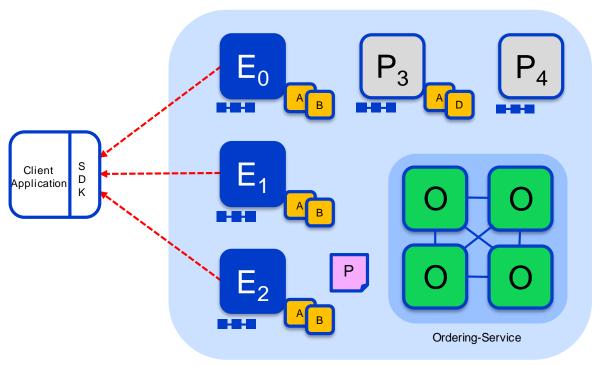

Transactions can be signed & encrypted

Key:

## Sample transaction: Step 3/7 – Proposal Response

Hyperledger Fabric Network

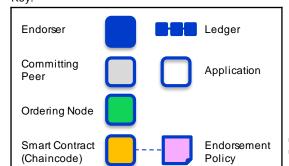

Application receives responses

RW sets are asynchronously returned to application

The RW sets are signed by each endorser, and also includes each record version number

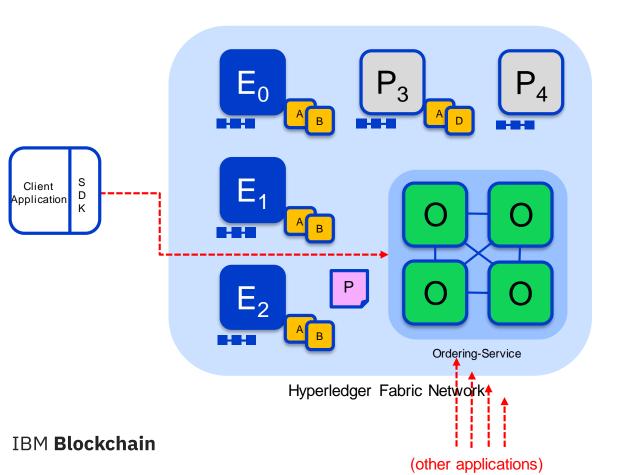

(This information will be checked much later in the consensus process)

Key:

### Sample transaction: Step 4/7 – Order Transaction

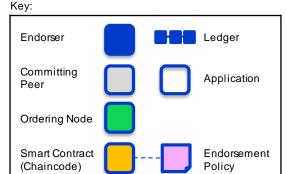

### Responses submitted for ordering

Application submits responses as a transaction to be ordered.

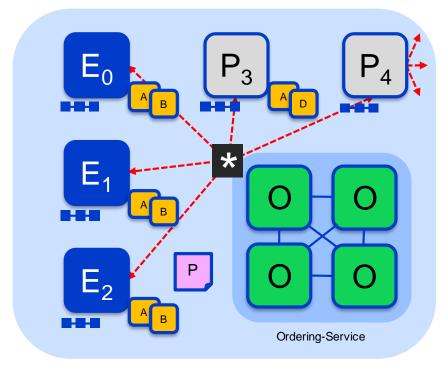

Ordering happens across the fabric in parallel with transactions submitted by other applications

### Sample transaction: Step 5/7 – Deliver Transaction

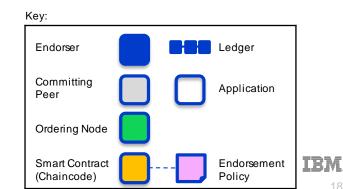

Hyperledger Fabric Network

### Orderer delivers to committing peers

Ordering service collects transactions into proposed blocks for distribution to committing peers. Peers can deliver to other peers in a hierarchy (not shown)

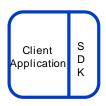

Different ordering algorithms available:

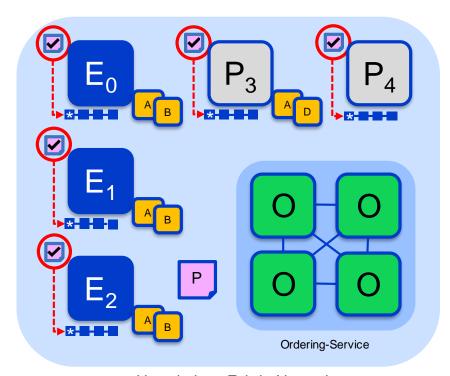

- SOLO (Single node, development)
- Kafka (Crash fault tolerance)

### Sample transaction: Step 6/7 – Validate Transaction

Hyperledger Fabric Network

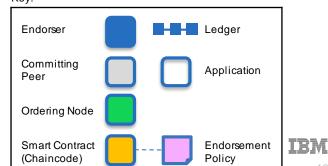

### Committing peers validate transactions

Every committing peer validates against the endorsement policy. Also check RW sets are still valid for current world state

Validated transactions are applied to the world state and retained on the ledger

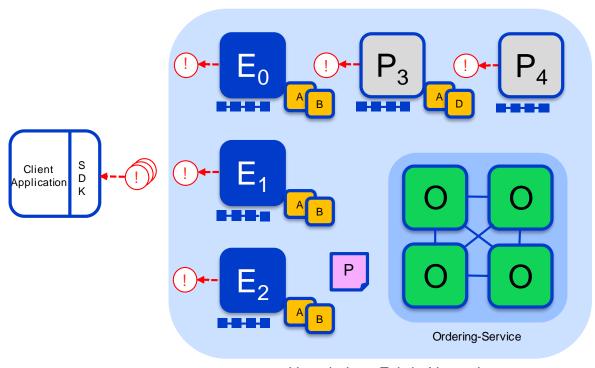

Invalid transactions are also retained on the ledger but do not update world state

#### Key:

### Sample transaction: Step 7/7 – Notify Transaction

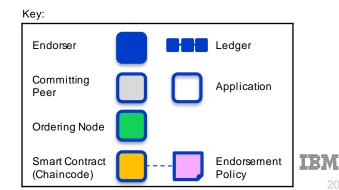

Hyperledger Fabric Network

### Committing peers notify applications

Applications can register to be notified when transactions succeed or fail, and when blocks are added to the ledger

Applications will be notified by each peer to which they are connected

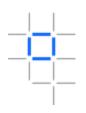

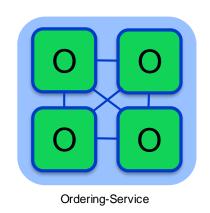

### **Technical Deep Dive**

- Architectural Overview
- Network Consensus
- [Channels and Ordering Service]
- Components
- Network setup
- Endorsement Policies
- Membership Services

# **Ordering Service**

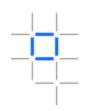

The ordering service packages transactions into blocks to be delivered to peers. Communication with the service is via channels.

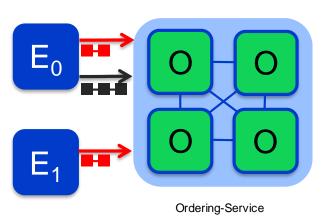

Different configuration options for the ordering service include:

- SOLO
  - Single node for development
- Kafka: Crash fault tolerant consensus
  - 3 nodes minimum
  - Odd number of nodes recommended.

### Channels

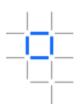

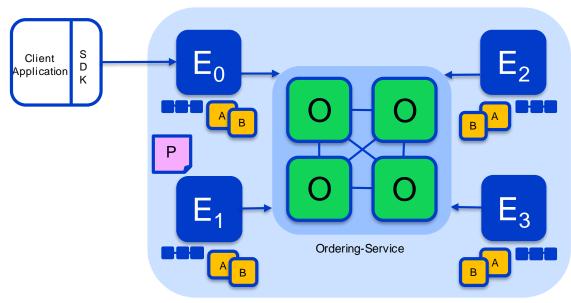

### Channels provide privacy between different ledgers

- Ledgers exist in the scope of a channel
  - Channels can be shared across an entire network of peers
  - Channels can be permissioned for a specific set of participants
- Chaincode is installed on peers to access the worldstate
- Chaincode is instantiated on specific channels
- Peers can participate in multiple channels
- Concurrent execution for performance and scalability

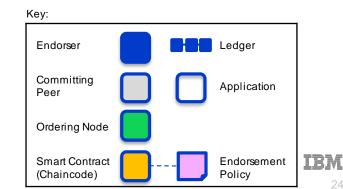

# Single Channel Network

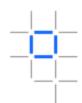

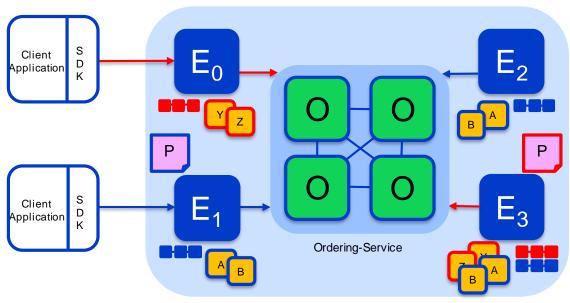

Hyperledger Fabric Network

- Similar to v0.6 PBFT model
- All peers connect to the same system channel (blue).
- All peers have the same chaincode and maintain the same ledger
- Endorsement by peers  $E_0$ ,  $E_1$ ,  $E_2$ and E<sub>3</sub>

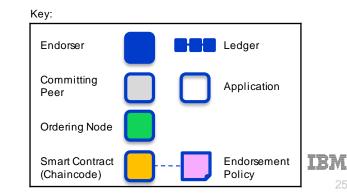

### Multi Channel Network

Hyperledger Fabric Network

- Peers E<sub>0</sub> and E<sub>3</sub> connect to the red channel for chaincodes Y and Z
- $E_1$ ,  $E_2$  and  $E_3$  connect to the blue channel for chaincodes A and B

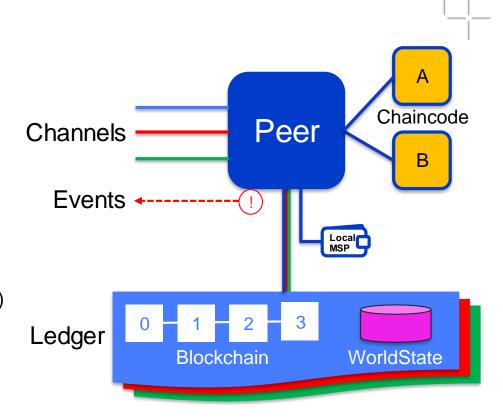

### **Technical Deep Dive**

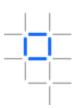

- Architectural Overview
- Network Consensus
- Channels and Ordering Service
- [Components]
- Network setup
- Endorsement Policies
- Membership Services

### Fabric Peer

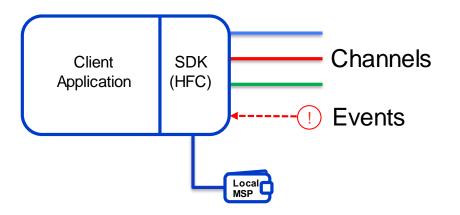

- Each peer:
  - Connects to one or more channels
  - Maintains one or more ledgers per channel
  - Maintains installed chaincode
  - Manages runtime docker containers for instantiated chaincode
    - Chaincode is instantiated on a channel
    - Runtime docker container shared by channels with same chaincode instantiated (no state stored in container)
  - Has a local MSP (Membership Services Provider) that provides crypto material
  - Emits events to the client application

# **Client Application**

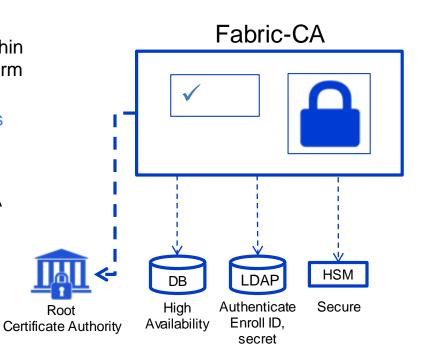

- Each client application uses Fabric SDK to:
  - Connects over channels to one or more peers
  - Connects over channels to one or more orderer nodes
  - Receives events from peers
  - Local MSP provides client crypto material
  - Client can be written in different languages (Node.js, Go, Java, Python?)

### Fabric-CA

- Default (optional) Certificate Authority within Fabric network for issuing Ecerts (long-term identity)
- Supports clustering for HA characteristics
- Supports LDAP for user authentication
- Supports HSM for security
- Can be configured as an intermediate CA

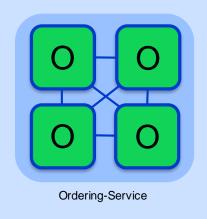

### **Technical Deep Dive**

- Architectural Overview
- Network Consensus
- Channels and Ordering Service
- Components
- [Network setup]
- Endorsement Policies
- Membership Services

# Bootstrap Network (1/6) - Configure & Start Ordering Service

Hyperledger Fabric Network

An Ordering Service is configured and started for the network:

\$ docker-compose [-f orderer.yml] ...

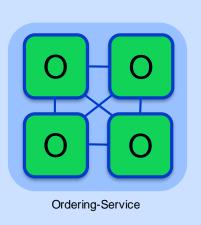

IBM

# Bootstrap Network (2/6) - Configure and Start Peer Nodes

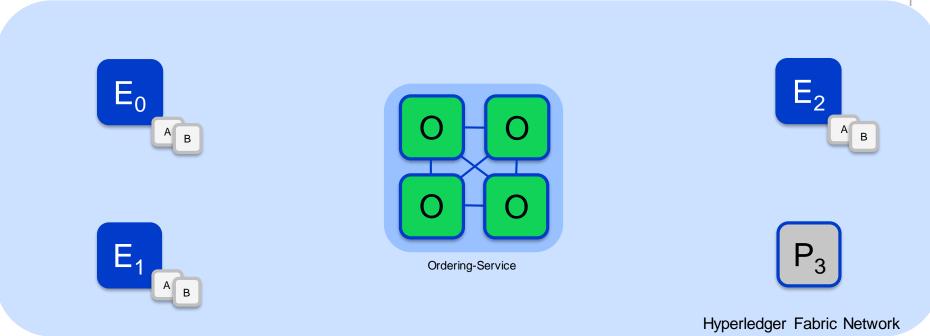

Hyperledger Fabric Network

A peer is configured and started for each Endorser or Committer in the network:

\$ peer node start ...

# Bootstrap Network (3/6) - Install Chaincode

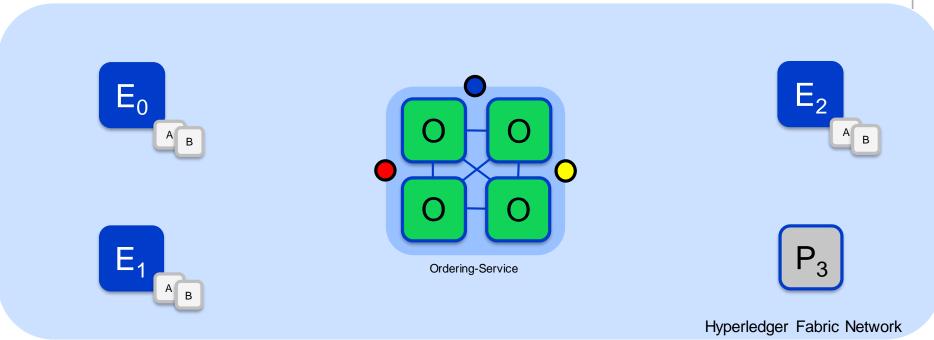

Chaincode is installed onto each Endorsing Peer that needs to execute it:

\$ peer chaincode install ...

# Bootstrap Network (4/6) – Create Channels

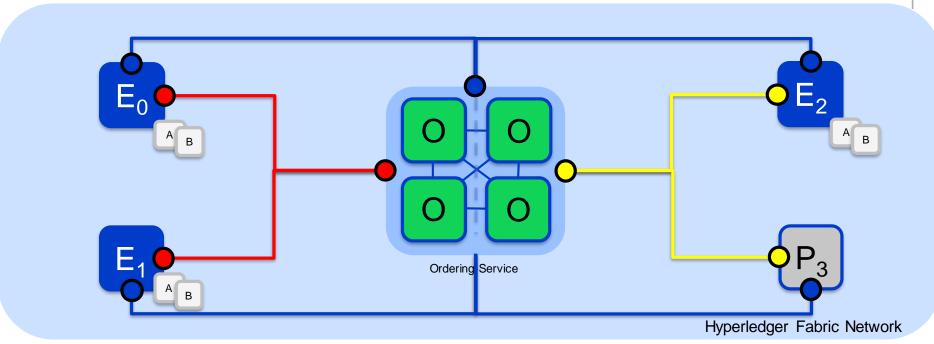

Channels are created on the ordering service:

\$ peer channel create -o [orderer] ...

IBM

# Bootstrap Network (5/6) – Join Channels

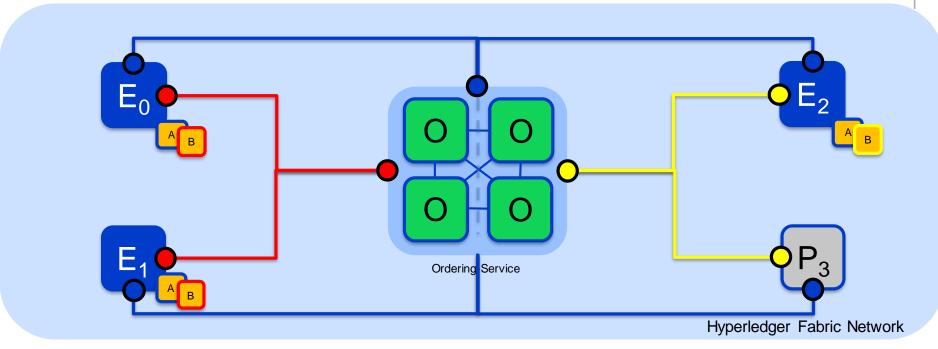

Peers that are permissioned can then join the channels they want to transact on:

\$ peer channel join ...

### Bootstrap Network (6/6) – Instantiate Chaincode

Peers finally instantiate the Chaincode on the channels they want to transact on:

\$ peer chaincode instantiate ... -P 'policy'

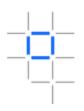

### **Technical Deep Dive**

- Architectural Overview
- Network Consensus
- Channels and Ordering Service
- Components
- Network setup
- [Endorsement Policies]
- Membership Services

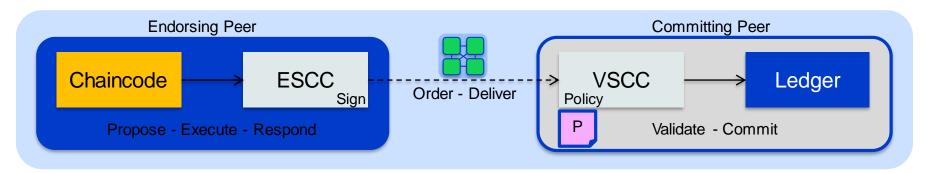

IBM

#### **Endorsement Policies**

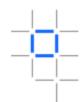

An endorsement policy describes the conditions by which a transaction can be endorsed. A transaction can only be considered valid if it has been endorsed according to its policy.

- Each chaincode is deployed with an Endorsement Policy
- ESCC (Endorsement System ChainCode) signs the proposal response on the endorsing peer
- VSCC (Validation System ChainCode) validates the endorsements

# **Endorsement Policy Syntax**

```
$ peer chaincode instantiate
-C mychannel
-n mycc
-v 1.0
-p chaincode_example02
-c '{"Args":["init","a", "100", "b","200"]}'
-P "AND('Org1MSP.member')"
```

Instantiate the chaincode mycc on channel mychannel with the policy AND('Org1MSP.member')

Policy Syntax: EXPR(E[, E...])

Where EXPR is either AND or OR and E is either a principal or nested EXPR

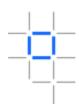

Principal Syntax: MSP.ROLE

Supported roles are: member and admin

Where MSP is the MSP ID, and ROLE is either "member" or "admin"

# **Endorsement Policy Examples**

#### Examples of policies:

- Request 1 signature from all three principals
  - AND('Org1.member', 'Org2.member', 'Org3.member')
- Request 1 signature from either one of the two principals
  - OR('Org1.member', 'Org2.member')
- Request either one signature from a member of the Org1 MSP or (1 signature from a member of the Org2 MSP and 1 signature from a member of the Org3 MSP)
  - OR('Org1.member', AND('Org2.member', 'Org3.member'))

### **Technical Deep Dive**

- Architectural Overview
- Network Consensus
- Channels and Ordering Service
- Components
- Network setup
- Endorsement Policies
- [Membership Services]

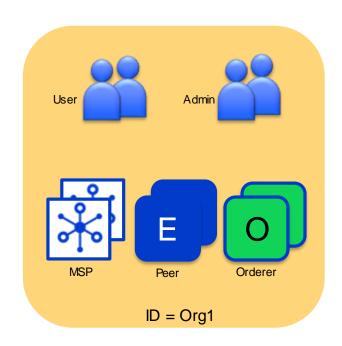

IBM Blockchain

# **Organisations**

#### Organisations define boundaries within a Fabric Blockchain Network

- Each organisation defines:
  - Membership Services Provider (MSP) for identities
  - Administrator(s)
  - Users
  - Peers
  - Orderers (optional)
- A network can include many organisations representing a consortium
- Each organisation has an ID

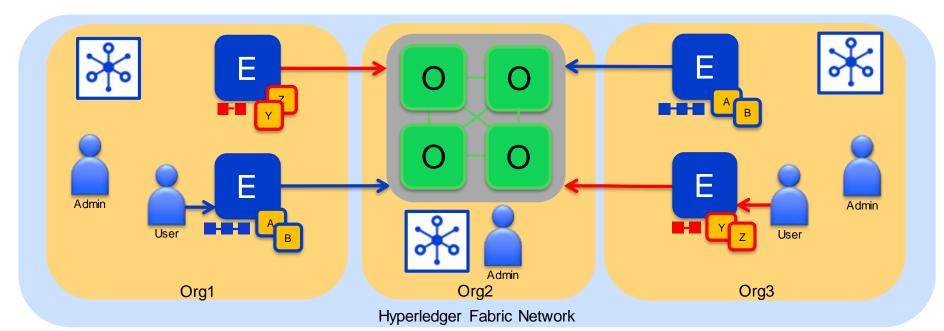

#### Consortium Network

#### An example consortium network of 3 organisations

- Orgs 1 and 3 run peers
- Org 2 provides the ordering service only

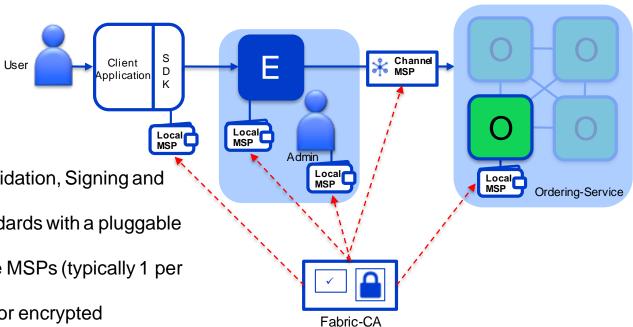

## Membership Services Provider - Overview

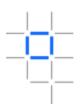

#### A MSP manages a set of identities within a distributed Fabric network

- Provides identity for:
  - Peers and Orderers
  - Client Applications
  - Administrators
- Identities can be issued by:
  - Fabric-CA
  - An external CA
- Provides: Authentication, Validation, Signing and Issuance
- Supports different crypto standards with a pluggable interface
- A network can include multiple MSPs (typically 1 per org)
- Includes TLS crypto material for encrypted communications

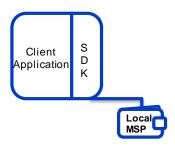

#### **User Identities**

#### Each client application has a local MSP to store user identities

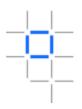

- Each local MSP includes:
  - Keystore
    - Private key for signing transactions
  - Signcert
    - Public x.509 certificate
- May also include TLS credentials
- Can be backed by a Hardware Security Module (HSM)

user@org1.example.com				
keystore	<private key=""></private>			
signcert	user@org1.example.com-cert.pem			

#### Admin Identities

#### Each Administrator has a local MSP to store their identity

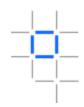

- Each local MSP includes:
  - Keystore
    - Private key for signing transactions
  - Signcert
    - Public x.509 certificate
- May also include TLS credentials
- Can be backed by a Hardware Security Module (HSM)

admin@org1.example.com				
keystore	<private key=""></private>			
signcert	admin@org1.example.com-cert.pem			

#### Peer and Orderer Identities

#### Each peer and orderer has a local MSP

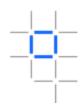

- Each local MSP includes:
  - keystore
    - Private key for signing transactions
  - signcert
    - Public x.509 certificate
- In addition Peer/Orderer MSPs identify authorized administrators:
  - admincerts
    - List of administrator certificates
  - cacerts
    - The CA public cert for verification
  - cris
    - List of revoked certificates
- Peers and Orderers also receive channel MSP info
- Can be backed by a Hardware Security Module (HSM)

peer@org1.example.com				
admincerts	admin@org1.example.com-cert.pem			
cacerts	ca.org1.example.com-cert.pem			
keystore	<private key=""></private>			
signcert	peer@org1.example.com-cert.pem			
crls	<pre><li>dist of revoked admin certificates&gt;</li></pre>			

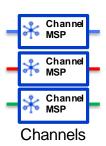

#### **Channel MSP information**

#### Channels include additional organisational MSP information

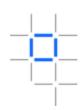

- Determines which orderers or peers can join the channel
- Determines client applications read or write access to the channel
- Stored in configuration blocks in the ledger
- Each channel MSP includes:
  - admincerts
    - Any public certificates for administrators
  - cacerts
    - The CA public certificate for this MSP
  - crls
    - List of revoked certificates
- Does not include any private keys for identity

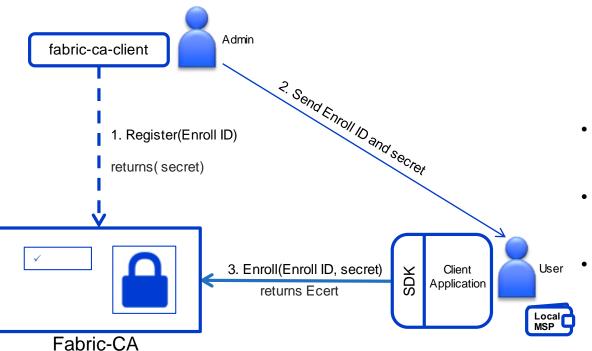

ID = MSP1					
admincerts	admin.org1.example.com-cert.pem				
cacerts	ca.org1.example.com-cert.pem				
crls	<pre><li>dist of revoked admin certificates&gt;</li></pre>				

# New User Registration and Enrollment

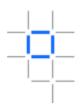

#### Registration and Enrollment

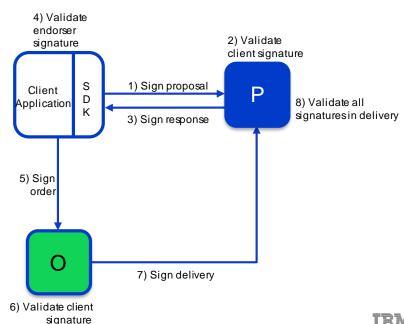

- Admin registers new user with Enroll ID
- User enrolls and receives credentials
  - Additional offline registration and enrollment options available

# **Transaction Signing**

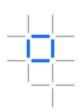

All transactions within a Hyperledger Fabric network are signed by permissioned actors, and those signatures validated

- Actors sign transactions with their enrolment private key
  - Stored in their local MSP
- Components validate transactions and certificates
  - Root CA certificates and CRLs stored in local MSP
  - Root CA certificates and CRLs stored in Org MSP in channel

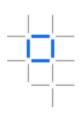

# Summary and Next Steps

- Apply shared ledgers and smart contracts to your Business Network
- Think about your participants, assets and business processes
- Spend time thinking about realistic business use cases
- Get some hands-on experience with the technology
- Start with a First Project
- IBM can help with your journey

#### **Fabric Commands**

- Fabric has the following commands:
  - peer ... (For operating and configuring a peer)
    - peer chaincode ... (Manages chaincode on the peer)
    - peer channel ... (Manages channels on the peer)
    - peer node ... (Manages the peer)
    - peer version (Returns the peer version)
  - cryptogen ... (Utility for generating crypto material)
  - configtxgen ... (Creates configuration data such as the genesis block)
  - configtxlator ...(Utility for generating channel configurations)
  - fabric-ca-client ... (Manages identities)
  - fabric-ca-server ... (Manages the Fabric-CA server)

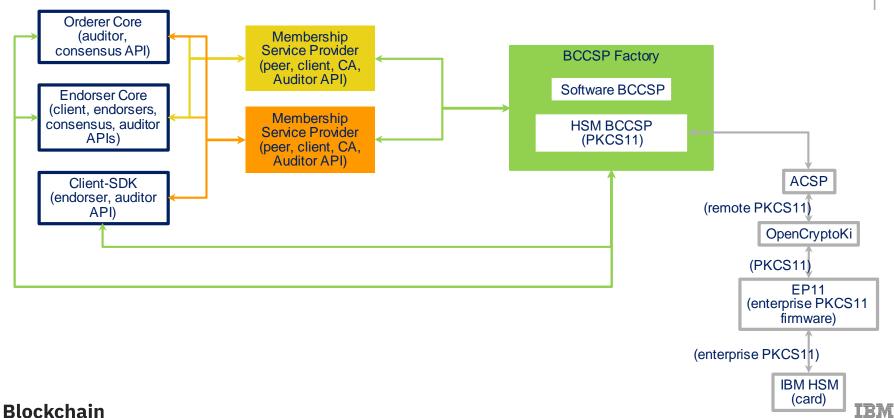

# **Configuration Detail**

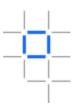

Path	MSPID	Attributes	Attributes	
config -> channel_group -> groups -> application -> groups	Org1MSP	mod_policy		Admins
		policies -> Admins	mod_policy	Admins
			policy -> value -> identities	Org1MSP, Admin
			Policy -> value -> rule	n_out_of
		Policies -> Readers	Mod_policy	Admins
			Policy -> value -> identities	Org1MSP
			Policy -> value -> rule	N_out_of
		Policies -> Writers	Mod_policy	Admins
			Policy -> value -> identities	Org1MSP
			Policy -> value -> rule	N_out_of

# MSP and BCCSP (Modularity and Decentralisation)

# Blockchain Crypto Service Provider (BCCSP)

- Pluggable implementation of cryptographic standards and algorithms.
- Pluggability
  - alternate implementations of crypto interface can be used within the Hyperledger Fabric code, without modifying the core
- Support for Multiple CSPs
  - Easy addition of more types of CSPs, e.g., of different HSM types
  - Enable the use of different CSP on different system components transparently
- International Standards Support
  - E.g., via a new/separate CSP
  - Interoperability among standards is not necessarily guaranteed

# IBM
